545. Boundary of Binary Tree

The **boundary** of a binary tree is the concatenation of the **root**, the **left boundary**, the **leaves** ordered from left-to-right, and the **reverse order** of the **right boundary**.

The **left boundary** is the set of nodes defined by the following:

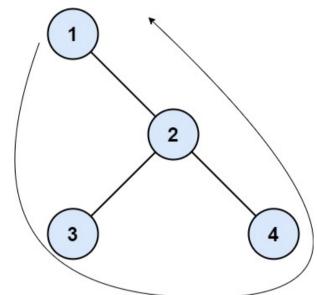

- The root node's left child is in the left boundary. If the root does not have a left child, then the left boundary is **empty**.
- If a node in the left boundary and has a left child, then the left child is in the left boundary.
- If a node is in the left boundary, has **no** left child, but has a right child, then the right child is in the
- The leftmost leaf is **not** in the left boundary.

The **right boundary** is similar to the **left boundary**, except it is the right side of the root's right subtree. Again, the leaf is **not** part of the **right boundary**, and the **right boundary** is empty if the root does not have a right child.

The **leaves** are nodes that do not have any children. For this problem, the root is **not** a leaf.

Given the root of a binary tree, return the values of its **boundary**.

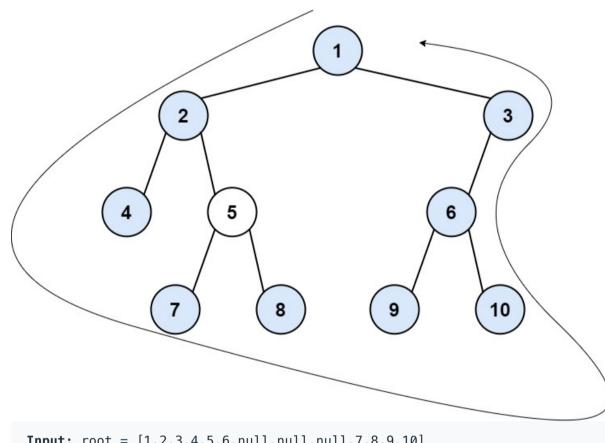

Example 1:

Input: root = [1,null,2,3,4] **Output:** [1,3,4,2]

- The left boundary is empty because the root does not have a left child. - The right boundary follows the path starting from the root's right child 2 -> 4.
- 4 is a leaf, so the right boundary is [2]. The leaves from left to right are [3,4].
- Concatenating everything results in [1] + [] + [3,4] + [2] = [1,3,4,2].

Example 2:

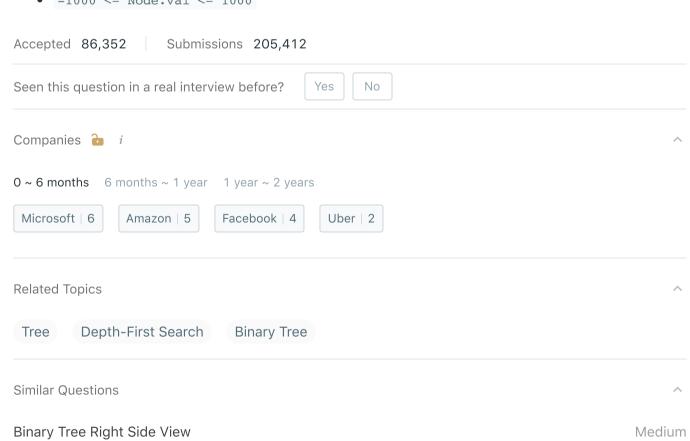

Input: root = [1,2,3,4,5,6,null,null,null,7,8,9,10]

Output: [1,2,4,7,8,9,10,6,3] **Explanation:**

- The left boundary follows the path starting from the root's left child 2 -> 4.
- 4 is a leaf, so the left boundary is [2]. - The right boundary follows the path starting from the root's right child 3 -> 6
- -> 10**.** 10 is a leaf, so the right boundary is [3,6], and in reverse order is [6,3].
- The leaves from left to right are [4,7,8,9,10].
- Concatenating everything results in [1] + [2] + [4,7,8,9,10] + [6,3] =[1,2,4,7,8,9,10,6,3].

Constraints:

- The number of nodes in the tree is in the range [1, 10⁴].
- -1000 <= Node.val <= 1000
